TECHNICAL SKILLS

- .NET Core .NET Framework
- C# Angular
- Software Architecture
- Microservices SQL Server
- PostgreSQL Azure
- Docker RabbitMQ Ionic
- Java

PROFESSIONAL SUMMARY

With over 15 years of experience transforming complex challenges into high-impact software solutions, I work as a Senior Software Engineer and Solutions Architect. My professional focus is on designing and building robust, scalable, and secure systems, with comprehensive experience in backend and frontend development, systems architecture, and DevOps practices. As a consultant for Rerum Engenharia de Sistemas, I have been allocated to technically lead critical projects in sectors such as finance and energy (ONS). In these roles, I was responsible for modernizing legacy systems, orchestrating the integration of multiple APIs (Fiserv, Matera), and designing microservices architectures. I was directly involved in the maintenance and implementation of new features, ensuring the continuous evolution and stability of the solutions. My experience covers the entire software lifecycle: from architectural design, through the implementation of complex business logic and automation of CI/CD pipelines (Azure DevOps, GitLab), to ensuring quality and security. I play an active role in supporting the team, assisting in the analysis and implementation of tasks to deliver technology that not only works, but that also drives business success.

KEY PROJECTS & CHALLENGES (GIT)

nm-frontend

2026 - PRESENT

MINISTERIO DO TRABALHO

Vue.js Vuex Vue Router Vue CLI Vuelidate

Context & Challenge:

The main challenges involved implementing complex CRUD (create, read, update, and delete) functionalities, including bulk operations, and managing the application state, such as loading and saving states. The developer faced problems with form data validation and manipulation, handling null or undefined values, and ensuring the reactivity of the interface. Other challenges included integrating with a REST API, implementing navigation flows, correcting data mapping bugs, and improving the overall user experience (UX).

nm-api

2026 - PRESENT

MINISTÉRIO DO TRABALHO

Node.js NestJS TypeScript Docker CircleCI

Context & Challenge:

The challenges consisted of building a scalable and efficient server-side application, managing dependencies, and configuring consistent development and production environments. There was a need to implement a robust CI/CD pipeline, integrate with cloud services (Azure) and a relational database (PostgreSQL), handling complexities such as foreign key violations. Other challenges included implementing complex business logic, such as authentication, authorization, and creating unit and integration tests to ensure software quality and stability.

dataminasmobile

JAN/2017 - PRESENT

DATA MINAS

Ionic

TypeScript

Node.js

Angular

Capacitor

Context & Challenge:

The main challenges were securely managing API secret keys, debugging the application on physical Android devices, and managing the complex dependencies of the Node.js ecosystem and native build.

Trybu

2025 - 2026

ELOGATE

C#

.NET Framework

.NET Core

ASP.NET Core

Entity Framework

Context & Challenge:

Integrating with multiple external APIs (Fiserv, Matera, WhatsApp, TrybuPay), each with its own rules and complexities. Managing complex business processes, such as creating digital accounts for different payment providers, lead balancing and distribution, and validating volatile API data (e.g., media handles with expiration times). Ensuring system robustness, scalability, and maintainability through error handling, retrocompatibility, and large data query manipulation.

Trybupay

2025 - 2026

ELOGATE

.NET Core

C#

ASP.NET Core

Entity Framework Core

SQL Server

Context & Challenge:

Integrating a financial platform with the Fiserv API for KYC processing and creating PIX accounts. The main challenges included implementing distinct KYC strategies by environment (synchronous for testing, asynchronous with polling for production); ensuring idempotence in webhook processing; maintaining consistency between client and account data in the database; handling polling timeouts for KYC; managing authentication and authorization with tokens and HMAC; and evolving the database schema in a compatible way with existing code via idempotent SQL scripts.

APITrybuAuth

2025 - 2026

ELOGATE

.NET Core

ASP.NET Core

C#

Entity Framework Core

JWT (JSON Web Tokens)

Context & Challenge:

Implementing a robust and scalable authentication and authorization system, integrating it securely with external services such as the Matera platform and the Azure ecosystem (Active Directory, Key Vault). Managing complex business rules for digital accounts, approval permissions, and data validation, ensuring consistency and security in secret management and concurrent handling.

portal-financeiro

2024 - PRESENT

RERUM

Angular

TypeScript

Node.js

GitLab CI/CD

IIS

Context & Challenge:

Managing the complexity of a large-scale Angular application, optimizing the CI/CD pipeline in GitLab for faster builds, and configuring the IIS server to support Angular routing. Other challenges included managing complex state with real-time data, optimizing performance, and maintaining scalable and standardized code.

server-financeiro

2024 - 2024

RERUM

.NET Core

.NET Framework 4.8

ASP.NET Core

YARP (API Gateway)

JWT (JSON Web Tokens)

Context & Challenge:

The main challenge was modernizing a legacy financial system through the introduction of a microservices architecture. This involved integrating new services (.NET Core) with old components (.NET Framework 4.8), creating a centralized and secure authentication and authorization system, managing routing and load balancing between services, and ensuring compatibility and performance in a hybrid and distributed environment, including automating deployment and monitoring service health.

sager.setup.dev

2020 - 2024

PROJECT

Python 3.7+

NodeJS

Docker

Docker Compose

Git

Context & Challenge:

The main challenges consisted of configuring complex and heterogeneous development environments, managing dependencies and software versions in multiple ecosystems (Python, Node.js, .NET), and automating the CI/CD process. There was also a need to orchestrate network, DNS, and authentication configuration for containerized services and ensure data security and consistency in different databases and environments (on-premise and cloud).

sager.cenario.configuracao.manter

2020 - 2024

ONS

.NET Core

ASP.NET Core

Docker

ONS.SDK

FluentValidation

Context & Challenge:

The challenges consisted of integrating and updating a proprietary SDK (ONS.SDK) to implement new features, such as branch archiving, in a RESTful API. There was also a need to ensure compatibility between .NET Core SDK versions and Docker images, requiring container infrastructure management, as well as implementing data validation and unit tests.

sager.apuracao.frontend

2020 - 2024

ONS

Angular

Angular CLI

TypeScript

Node.js

HTML/CSS

Context & Challenge:

The main challenges included implementing complex features such as exporting data to Excel spreadsheets, correcting bugs related to date manipulation in calendars and components, and creating a robust architecture for error handling and state management (loaders, spinners) throughout the application. There was also a need to integrate third-party UI libraries (Pikaday, Owl Date Time) and refactor the base code, migrating components and services to a more organized and scalable modular structure.

ONS.SDK

2020 - 2024

ONS

.NET Core C# Dependency Injection HttpClient
Microsoft.Extensions.Configuration

Context & Challenge:

Developing and integrating a new archiving feature in a customized SDK. This involved creating a service to make HTTP calls to an external system, managing specific configurations, handling errors, and adapting the existing software architecture to accommodate the new module.

SAGER

2020 - 2024

ONS

.Net Core SQL Server Azure DevOps PowerDesign NPM

Context & Challenge:

Developing and integrating a complex system for event apuración in Units Generadoras for ONS, handling intricate business rules such as franchise logic and balance calculation. Technical challenges included optimizing performance through caching, ensuring code quality with unit and integration tests, managing and versioning the data model and database scripts, and implementing a robust architecture using design patterns like Factory and Repository.

Sicop

2015 - 2018

ONS

ASP.NET MVC C# JavaScript AngularJS jQuery

Context & Challenge:

Developing and improving data query interfaces in a complex management system, implementing filtering (by date, markings, and other criteria), ordering, and ensuring data consistency and integrity. The work required integrating with domain services and existing business rules to improve the user experience.
